Tutorial Sheet 3: Graph Theory basics.
1 September 2022

Important: The question marked with a ♠ is to be written on a sheet of paper and submitted to your TA within the first 10 minutes of the beginning of your tutorial session. Questions marked with a * are optional challenge problems and are not to be discussed in the tutorial.

Problem 1
Prove that every simple graph has two vertices of the same degree.

Problem 2 [1, Prob 2, page 30]
Let $d \in \mathbb{N}$ and $V = \{0,1\}^d$, i.e., V is the set of all 0-1 sequences of length d. We define the edge set as follows: there is an edge between two sequences if they differ in exactly one position. This graph is known as the d-dimensional cube. Determine the average degree, diameter, girth and circumference of the *d-dimensional cube*. Note that the circumference of a graph is the length of the longest cycle in the graph.

Problem 3 [1, Prob 3, page 30]
Let G be a graph containing a cycle C, and assume that G contains a path of length at least k between two vertices of C. Show that G contains a cycle of length at least $\sqrt{k}$.

Problem 4 ♠
Suppose we are given that there exists a homomorphism φ from $G = (V,E)$ to $G' = (V',E')$. We assume that $V, V' \neq \emptyset$. Prove that there is an independent set in G whose size is at least $|V|/|V'|$. Note: If $|V'| \geq |V|$ then the result is trivially true since, for any $v \in V$, the set $\{v\}$ is trivially an independent set.

Problem 5 *
For $k \geq 0$, a k-colouring of a graph $G = (V,E)$ is a function $f : V \to [k]$ (where $[n]$ is the set $\{1,2,\ldots,n\}$) such that for all $(u,v) \in E$, $f(u) \neq f(e)$. We say a graph is k-colourable if a k-colouring exists for the graph. Show that G is k-colourable if and only iff there is a homomorphism from G to the complete graph on k vertices (i.e. K_k).

Problem 6 [1, Prob 6, page 30]
Show that $\text{rad}(G) \leq \text{diam}(G) \leq 2\text{rad}(G)$ for every graph G.

Problem 7
Given a set X, a function $f : X \times X \to [0,\infty)$ is called a *distance* if

1. $\forall x,y \in X : f(x,y) = 0 \Leftrightarrow x = y$,
2. $\forall x,y \in X : f(x,y) = f(y,x)$, and
3. $\forall x,y,z \in X : f(x,y) \leq f(x,z) + f(z,y)$.

Problem 7.1
Prove that the graph distance defined as the length of the shortest path between two vertices is a distance.

Problem 7.2
Suppose that given a graph $G = (V, E)$ we have a function $w : E \to \mathbb{R}$ and we define the length of the path $x_0 \dots x_k$ to be $\sum_{i=1}^{k} w(x_{i-1}x_i)$. As before we define the "distance" between two vertices to be the length of the shortest path between the two vertices. What condition do we need on w for this "distance" to actually be a distance? Which of the requirements of a distance get violated if w is allowed to assign negative values? Do any requirements get violated if w is allowed to assign the value 0?

Problem 8
Given two graphs $G = (V, E)$ and $G' = (V', E')$ such that $|V| = |V'|$, suppose we can find a $\phi : V \to V'$ which is a bijection and is a graph homomorpishm. Prove that diameter$(G') \leq$ diameter(G). Draw an example where the inequality is strict. Use this fact to prove that two isomorphic graphs have the same diameter.

Problem 9 *
Given a set of vertices V such that $|V| = n$, and given k such that $\binom{n}{2} \geq k \geq 0$, let us denote by $A_{n,k}$ the set of all simple graphs on V with exactly k edges. We now define a graph whose vertices are the elements of $A_{n,k}$. We put an edge between graphs $G_1 = (V, E_1)$ and $G_2 = (V, E_2)$ if $|E_1 \setminus E_2| = 1$. What is the diameter of this graph in terms of k? Does the diameter always increase as k increases?
