# Statistical Natural Language Parsing 

## Mausam

(Based on slides of Michael Collins, Dan Jurafsky, Dan Klein, Chris Manning, Ray Mooney, Luke Zettlemoyer)

## Two views of linguistic structure: 1. Constituency (phrase structure)

- Phrase structure organizes words into nested constituents.
- How do we know what is a constituent? (Not that linguists don’t argue about some cases.)
- Distribution: a constituent behaves as a unit that can appear in different places:
- John talked [to the children] [about drugs].
- John talked [about drugs] [to the children].
- *John talked drugs to the children about
- Substitution/expansion/pro-forms:
- I sat [on the box/right on top of the box/there].
- Coordination, regular internal structure, no intrusion,
 fragments, semantics, ...

## Two views of linguistic structure: <br> 2. Dependency structure

- Dependency structure shows which words depend on (modify or are arguments of) which other words.

## Why Parse?

- Part of speech information
- Phrase information
- Useful relationships

$\Rightarrow$ "the burglar" is the subject of "robbed"

## The rise of annotated data: The Penn Treebank

[Marcus et al. 1993, Computational Linguistics]

```
( (S
    (NP-SBJ (DT The) (NN move))
    (VP (VBD followed)
        (NP
        (NP (DT a) (NN round))
        (PP (IN of)
            (NP
            (NP (JJ similar) (NNS increases))
            (PP (IN by)
            (NP (JJ other) (NNS lenders)))
            (PP (IN against)
            (NP (NNP Arizona) (JJ real) (NN estate) (NNS loans))))))
        (, ,)
        (S-ADV
        (NP-SBJ (-NONE- *))
        (VP (VBG reflecting)
        (NP
            (NP (DT a) (VBG continuing) (NN decline))
            (PP-LOC (IN in)
            (NP (DT that) (NN market)))))))
    (. .)))
```

## Penn Treebank Non-terminals

Table 1.2. The Penn Treebank syntactic tagset

| ADJP | Adjective phrase |
| :--- | :--- |
| ADVP | Adverb phrase |
| NP | Noun phrase |
| PP | Prepositional phrase |
| S | Simple declarative clause |
| SBAR | Subordinate clause |
| SBARQ | Direct question introduced by $w h$-element |
| SINV | Declarative sentence with subject-aux inversion |
| SQ | Yes/no questions and subconstituent of SBARQ excluding wh-element |
| VP | Verb phrase |
| WHADVP | Wh-adverb phrase |
| WHNP | Wh-noun phrase |
| WHPP | Wh-prepositional phrase |
| X | Constituent of unknown or uncertain category |
| $*$ | "Understood" subject of infinitive or imperative |
| 0 | Zero variant of that in subordinate clauses |
| T | Trace of wh-Constituent |

## Statistical parsing applications

Statistical parsers are now robust and widely used in larger NLP applications:

- High precision question answering [Pasca and Harabagiu SIGIR 2001]
- Improving biological named entity finding [Finkel et al. JNLPBA 2004]
- Syntactically based sentence compression [Lin and Wilbur 2007]
- Extracting opinions about products [Bloom et al. NAACL 2007]
- Improved interaction in computer games [Gorniak and Roy 2005]
- Helping linguists find data [Resnik et al. BLS 2005]
- Source sentence analysis for machine translation [Xu et al. 2009]
- Relation extraction systems [Fundel et al. Bioinformatics 2006]

## Example Application: Machine Translation

- The boy put the tortoise on the rug
- लड़के ने रखा कछुआ ऊपर कालीन
- SVO vs. SOV; preposition vs. post-position

## Example Application: Machine Translation

- The boy put the tortoise on the rug
- लड़के ने रखा कछुआ ऊपर कालीन
- SVO vs. SOV; preposition vs. post-position

## Example Application: Machine Translation

- The boy put the tortoise on the rug
- लड़के ने रखा कछुआ ऊपर कालीन
- SVO vs. SOV; preposition vs. post-position

## Example Application: Machine Translation

- The boy put the tortoise on the rug
- लड़के ने रखा कछुआ ऊपर कालीन
- SVO vs. SOV; preposition vs. post-position

## Example Application: Machine Translation

- The boy put the tortoise on the rug
- लड़के ने रखा कछुआ ऊपर कालीन
- SVO vs. SOV; preposition vs. post-position

## Pre 1990 ("Classical") NLP Parsing

- Goes back to Chomsky's PhD thesis in 1950s
- Wrote symbolic grammar (CFG or often richer) and lexicon

$$
\begin{aligned}
& S \rightarrow N P V P \\
& N P \rightarrow(D T) N N \\
& N P \rightarrow N N \text { NNS }
\end{aligned}
$$

$$
\mathrm{NP} \rightarrow \mathrm{NNP} \quad \mathrm{VBP} \rightarrow \text { interest }
$$

$$
\mathrm{VP} \rightarrow \mathrm{~V} \mathrm{NP} \quad \mathrm{VBZ} \rightarrow \text { rates }
$$

- Used grammar/proof systems to prove parses from words
- This scaled very badly and didn't give coverage. For sentence: Fed raises interest rates $0.5 \%$ in effort to control inflation
- Minimal grammar:
- Simple 10 rule grammar: 36 parses
- Real-size broad-coverage grammar:

592 parses
millions of parses

## Classical NLP Parsing: The problem and its solution

- Categorical constraints can be added to grammars to limit unlikely/weird parses for sentences
- But the attempt make the grammars not robust
- In traditional systems, commonly $30 \%$ of sentences in even an edited text would have no parse.
- A less constrained grammar can parse more sentences
- But simple sentences end up with ever more parses with no way to choose between them
- We need mechanisms that allow us to find the most likely parse(s) for a sentence
- Statistical parsing lets us work with very loose grammars that admit millions of parses for sentences but still quickly find the best parse(s)

## Context Free Grammars and Ambiguities

## Context-Free Grammars

Hopcroft and Ullman, 1979
A context free grammar $G=(N, \Sigma, R, S)$ where:

- $N$ is a set of non-terminal symbols
- $\Sigma$ is a set of terminal symbols
- $R$ is a set of rules of the form $X \rightarrow Y_{1} Y_{2} \ldots Y_{n}$ for $n \geq 0, X \in N, Y_{i} \in(N \cup \Sigma)$
- $S \in N$ is a distinguished start symbol

## Context-Free Grammars in NLP

- A context free grammar G in NLP $=(N, C, \Sigma, S, L, R)$
- $\Sigma$ is a set of terminal symbols
- C is a set of preterminal symbols
- N is a set of nonterminal symbols
- $S$ is the start symbol $(S \in N)$
- $L$ is the lexicon, a set of items of the form $X \rightarrow x$
- $X \in C$ and $x \in \Sigma$
- $R$ is the grammar, a set of items of the form $X \rightarrow \gamma$
- $\mathrm{X} \in \mathrm{N}$ and $\gamma \in(\mathrm{N} \cup \mathrm{C})^{*}$
- By usual convention, S is the start symbol, but in statistical NLP, we usually have an extra node at the top (ROOT, TOP)
- We usually write $e$ for an empty sequence, rather than nothing

## A Context Free Grammar of English

$$
\begin{aligned}
& N=\{\mathrm{S}, \mathrm{NP}, \mathrm{VP}, \mathrm{PP}, \mathrm{DT}, \mathrm{Vi}, \mathrm{Vt}, \mathrm{NN}, \mathrm{IN}\} \\
& S=\mathrm{S} \\
& \Sigma=\{\text { sleeps, saw, man, woman, telescope, the, with, in }\}
\end{aligned}
$$

$R=$| S | $\rightarrow$ | NP | VP |
| :--- | :--- | :--- | :--- |
| VP | $\rightarrow$ | Vi |  |
| VP | $\rightarrow$ | Vt | NP |
| VP | $\rightarrow$ | VP | PP |
| NP | $\rightarrow$ | DT | NN |
| NP | $\rightarrow$ | NP | PP |
| PP | $\rightarrow$ | IN | NP |

| Vi | $\rightarrow$ | sleeps |
| :--- | :--- | :--- |
| Vt | $\rightarrow$ | saw |
| NN | $\rightarrow$ | man |
| NN | $\rightarrow$ woman |  |
| NN | $\rightarrow$ | telescope |
| DT | $\rightarrow$ | the |
| IN | $\rightarrow$ | with |
| IN | $\rightarrow$ | in |

Note: $\mathrm{S}=$ sentence, $\mathrm{VP}=$ verb phrase, $\mathrm{NP}=$ noun phrase, $\mathrm{PP}=$ prepositional phrase, $\mathrm{DT}=$ determiner, $\mathrm{Vi}=$ intransitive verb, $\mathrm{V} \mathrm{t}=$ transitive verb, $\mathrm{NN}=$ noun, $\mathrm{IN}=$ preposition

## Left-Most Derivations

A left-most derivation is a sequence of strings $s_{1} \ldots s_{n}$, where

- $s_{1}=S$, the start symbol
- $s_{n} \in \Sigma^{*}$, i.e. $s_{n}$ is made up of terminal symbols only
- Each $s_{i}$ for $i=2 \ldots n$ is derived from $s_{i-1}$ by picking the left-most non-terminal $X$ in $s_{i-1}$ and replacing it by some $\beta$ where $X \rightarrow \beta$ is a rule in $R$
For example: [S], [NP VP], [D N VP], [the N VP], [the man VP], [the man Vi ], [the man sleeps]
Representation of a derivation as a tree:

## Properties of CFGs

- A CFG defines a set of possible derivations
- A string $s \in \Sigma^{*}$ is in the language defined by the CFG if there is at least one derivation that yields $s$
- Each string in the language generated by the CFG may have more than one derivation ("ambiguity")

## A Fragment of a Noun Phrase Grammar

| NN | $\Rightarrow$ | box |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| NN | $\Rightarrow$ | car |  |  |
| NN | $\Rightarrow$ | mechanic |  |  |
| NN | $\Rightarrow$ | pigeon |  |  |
| DT | $\Rightarrow$ | the |  |  |
| DT | $\Rightarrow$ | a | $\Rightarrow$ | fast |
| JJ | $\Rightarrow$ | metal |  |  |
| JJ | $\Rightarrow$ | idealistic |  |  |
| JJ | $\Rightarrow$ | clay |  |  |

## Extended Grammar with Prepositional Phrases

## Generates:

in a box, under the box, the fast car mechanic under the pigeon in the box,...

## Verbs, Verb Phrases and Sentences

- Basic Verb Types
$\mathrm{Vi}=$ Intransitive verb e.g., sleeps, walks, laughs
Vt $=$ Transitive verb e.g., sees, saw, likes
$\mathrm{Vd}=$ Ditransitive verb e.g., gave
- Basic VP Rules
$\mathrm{VP} \rightarrow \mathrm{Vi}$
$V P \rightarrow V t \quad N P$
$\mathrm{VP} \rightarrow \mathrm{Vd} \mathrm{NP}$ NP
- Basic S Rule

$$
S \quad \rightarrow \mathrm{NP} \quad \mathrm{VP}
$$

## Examples of VP:

sleeps, walks, likes the mechanic, gave the mechanic the fast car Examples of S : the man sleeps, the dog walks, the dog gave the mechanic the fast car

## PPs Modifying Verb Phrases

A new rule: $V P \rightarrow V P \quad P P$
New examples of VP:
sleeps in the car, walks like the mechanic, gave the mechanic the fast car on Tuesday, ...

## Complementizers and SBARs

- Complementizers

COMP = complementizer e.g., that

- SBAR

SBAR $\rightarrow$ COMP S

## Examples:

that the man sleeps, that the mechanic saw the dog . .

## More Verbs

- New Verb Types
$\mathrm{V}[5]$ e.g., said, reported
$V[6]$ e.g., told, informed
$\mathrm{V}[7]$ e.g., bet
- New VP Rules

| $V P$ | $\rightarrow$ | $V[5]$ | SBAR |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $V P$ | $\rightarrow$ | $V[6]$ | $N P$ | SBAR |  |
| $V P$ | $\rightarrow$ | $V[7]$ | $N P$ | $N P$ | SBAR |

Examples of New VPs:
said that the man sleeps
told the dog that the mechanic likes the pigeon
bet the pigeon $\$ 50$ that the mechanic owns a fast car

## Coordination

- A New Part-of-Speech:
$C C=$ Coordinator e.g., and, or, but
- New Rules

| $N P$ | $\rightarrow$ | $N P$ | $C C$ | $N P$ |
| :--- | :--- | :--- | :--- | :--- |
| $\bar{N}$ | $\rightarrow$ | $\bar{N}$ | $C C$ | $\bar{N}$ |
| $V P$ | $\rightarrow$ | $V P$ | $C C$ | $V P$ |
| $S$ | $\rightarrow$ | $S$ | $C C$ | $S$ |
| SBAR | $\rightarrow$ | SBAR | CC | SBAR |

## Much more remains...

- Agreement

The dogs laugh vs. The dog laughs

- Wh-movement

The dog that the cat liked

- Active vs. passive

The dog saw the cat vs.
The cat was seen by the dog

- If you're interested in reading more:

Syntactic Theory: A Formal Introduction, 2nd Edition. Ivan A. Sag, Thomas Wasow, and Emily M. Bender.

## Attachment ambiguities

- A key parsing decision is how we 'attach' various constituents
- PPs, adverbial or participial phrases, infinitives, coordinations, etc.

The board approved [its acquisition] [by Royal Trustco Ltd.] [of Toronto]
[for \$27 a share]
[at its monthly meeting].

## Attachment ambiguities

- A key parsing decision is how we 'attach' various constituents
- PPs, adverbial or participial phrases, infinitives, coordinations, etc.

The board approved [its acquisition)[by Royal Trustco Ltd.]

- Catalan numbers: $C_{n}=(2 n)!/[(n+1)!n!]$
- An exponentially growing series, which arises in many tree-like contexts:
- E.g., the number of possible triangulations of a polygon with $n+2$ sides
- Turns up in triangulation of probabilistic graphical models....

## Attachments

- I cleaned the dishes from dinner
- I cleaned the dishes with detergent
- I cleaned the dishes in my pajamas
- I cleaned the dishes in the sink

## Syntactic Ambiguities I

- Prepositional phrases:

They cooked the beans in the pot on the stove with handles.

- Particle vs. preposition:

The lady dressed up the staircase.

- Complement structures

The tourists objected to the guide that they couldn't hear.
She knows you like the back of her hand.

- Gerund vs. participial adjective

Visiting relatives can be boring.
Changing schedules frequently confused passengers.

## Syntactic Ambiguities II

- Modifier scope within NPs impractical design requirements plastic cup holder
- Multiple gap constructions

The chicken is ready to eat.
The contractors are rich enough to sue.

- Coordination scope:

Small rats and mice can squeeze into holes or cracks in the wall.

## Non-Local Phenomena

- Dislocation / gapping
- Which book should Peter buy?
- A debate arose which continued until the election.
- Binding
- Reference
- The IRS audits itself
- Control
- I want to go
- I want you to go

Product Details (from Amazon)
Hardcover: 1779 pages
Publisher: Longman; 2nd Revised edition
Language: English
ISBN-10: 0582517346
ISBN-13: 978-0582517349
Product Dimensions: $8.4 \times 2.4 \times 10$ inches
Shipping Weight: 4.6 pounds

## Parsing: Two problems to solve: 1. Repeated work...

## Parsing: Two problems to solve: 1. Repeated work...

## Parsing: Two problems to solve: 2. Choosing the correct parse

- How do we work out the correct attachment:
- She saw the man with a telescope
- Is the problem 'Al complete'? Yes, but ...
- Words are good predictors of attachment
- Even absent full understanding
- Moscow sent more than 100,000 soldiers into Afghanistan ...
- Sydney Water breached an agreement with NSW Health ...
- Our statistical parsers will try to exploit such statistics.

## Probabilistic Context Free Grammar

## Probabilistic - or stochastic - context-free grammars (PCFGs)

- $G=(\Sigma, N, S, R, P)$
- T is a set of terminal symbols
- $N$ is a set of nonterminal symbols
- $S$ is the start symbol $(S \in N)$
- $R$ is a set of rules/productions of the form $X \rightarrow \gamma$
- $P$ is a probability function
- $\mathrm{P}: \mathrm{R} \rightarrow[0,1]$
- $\forall X \in N, \sum_{X \rightarrow \gamma \in R} P(X \rightarrow \gamma)=1$
- A grammar G generates a language model L.

$$
{ }_{T^{*}} P()=1
$$

## PCFG Examole

| S | $\Rightarrow$ | NP | VP | 1.0 |
| :--- | :--- | :--- | :--- | :--- |
| VP | $\Rightarrow$ | Vi |  | 0.4 |
| VP | $\Rightarrow$ | Vt | NP | 0.4 |
| VP | $\Rightarrow$ | VP | PP | 0.2 |
| NP | $\Rightarrow$ | DT | NN | 0.3 |
| NP | $\Rightarrow$ | NP | PP | 0.7 |
| PP | $\Rightarrow$ | P | NP | 1.0 |

| Vi | $\Rightarrow$ | sleeps | 1.0 |
| :--- | :--- | :--- | :--- |
| Vt | $\Rightarrow$ | saw | 1.0 |
| NN | $\Rightarrow$ | man | 0.7 |
| NN | $\Rightarrow$ | woman | 0.2 |
| NN | $\Rightarrow$ | telescope | 0.1 |
| DT | $\Rightarrow$ | the | 1.0 |
| IN | $\Rightarrow$ | with | 0.5 |
| IN | $\Rightarrow$ | in | 0.5 |

- Probability of a tree $t$ with rules

$$
\alpha_{1} \rightarrow \beta_{1} \subset \alpha_{2} \rightarrow \beta_{2} \subset \triangleright \triangleright \triangleright^{c} \alpha_{n} \rightarrow \beta_{n}
$$

is

$$
p(t)=\prod_{i=1}^{n} q\left(\boldsymbol{\alpha}_{i} \rightarrow \boldsymbol{\beta}_{i}\right)
$$

where $q(\alpha \rightarrow \beta)$ is the probability for rule $\alpha \rightarrow \beta$.

## Example of a PCFG

| S | $\Rightarrow$ | NP | VP | 1.0 |
| :--- | :--- | :--- | :--- | :--- |
| VP | $\Rightarrow$ | Vi |  | 0.4 |
| VP | $\Rightarrow$ | Vt | NP | 0.4 |
| VP | $\Rightarrow$ | VP | PP | 0.2 |
| NP | $\Rightarrow$ | DT | NN | 0.3 |
| NP | $\Rightarrow$ | NP | PP | 0.7 |
| PP | $\Rightarrow$ | P | NP | 1.0 |

| Vi | $\Rightarrow$ sleeps | 1.0 |
| :--- | :--- | :--- |
| Vt | $\Rightarrow$ saw | 1.0 |
| $\mathrm{NN} \Rightarrow$ man | 0.7 |  |
| $\mathrm{NN} \Rightarrow$ woman | 0.2 |  |
| $\mathrm{NN} \Rightarrow$ telescope | 0.1 |  |
| $\mathrm{DT} \Rightarrow$ the | 1.0 |  |
| $\mathrm{IN} \Rightarrow$ with | 0.5 |  |
| $\mathrm{IN} \Rightarrow$ in | 0.5 |  |

- Probability of a tree $t$ with rules

$$
\alpha_{1} \rightarrow \beta_{1}, \alpha_{2} \rightarrow \beta_{2}, \ldots, \alpha_{n} \rightarrow \beta_{n}
$$

is $p(t)=\prod_{i=1}^{n} q\left(\alpha_{i} \rightarrow \beta_{i}\right)$ where $q(\alpha \rightarrow \beta)$ is the probability for rule $\alpha \rightarrow \beta$.

## Probability of a Parse

| S | $\Rightarrow$ | NP | VP | 1.0 |
| :--- | :--- | :--- | :--- | :--- |
| VP | $\Rightarrow$ | Vi |  | 0.4 |
| VP | $\Rightarrow$ | Vt | NP | 0.4 |
| VP | $\Rightarrow$ | VP | PP | 0.2 |
| NP | $\Rightarrow$ | DT | NN | 0.3 |
| NP | $\Rightarrow$ | NP | PP | 0.7 |
| PP | $\Rightarrow$ | P | NP | 1.0 |

| Vi | $\Rightarrow$ | sleeps | 1.0 |
| :--- | :--- | :--- | :--- |
| Vt | $\Rightarrow$ | saw | 1.0 |
| NN | $\Rightarrow$ | man | 0.7 |
| NN | $\Rightarrow$ | woman | 0.2 |
| NN | $\Rightarrow$ | telescope | 0.1 |
| DT | $\Rightarrow$ | the | 1.0 |
| IN | $\Rightarrow$ | with | 0.5 |
| IN | $\Rightarrow$ | in | 0.5 |

The man saw the woman with the telescope
$p\left(t_{s}\right)=1.8^{*} 0.3^{*} 1.0^{*} 0.7^{*} 0.2^{*} 0.4^{*} 1.0^{*} 0.3^{*} 1.0^{*} 0.2^{*} 0.4^{*} 0.5^{*} 0.3^{*} 1.0^{*} 0.1$

## PCFGs: Learning and Inference

- Model
- The probability of a tree $t$ with $n$ rules $\alpha_{i} \rightarrow \beta_{i}, i=1$..n

$$
p(t)=\prod_{i=1}^{n} q\left(\alpha_{i} \rightarrow \beta_{i}\right)
$$

- Learning
- Read the rules off of labeled sentences, use ML estimates for probabilities

$$
q_{M L}(\alpha \rightarrow \beta)=\frac{\operatorname{Count}(\alpha \rightarrow \beta)}{\operatorname{Count}(\alpha)}
$$

- and use all of our standard smoothing tricks!
- Inference
- For input sentence s, define $T(s)$ to be the set of trees whose yield is $s$ (whole leaves, read left to right, match the words in s)

$$
t^{*}(s)=\arg \max _{t \in \mathcal{T}(s)} p(t)
$$

## Grammar Transforms

## Chomsky Normal Form

- All rules are of the form $X \rightarrow Y Z$ or $X \rightarrow w$
- $X, Y, Z \in N$ and $w \in \Sigma$
- A transformation to this form doesn't change the weak generative capacity of a CFG
- That is, it recognizes the same language
- But maybe with different trees
- Empties and unaries are removed recursively
- $n$-ary rules are divided by introducing new nonterminals ( $n>2$ )

## A phrase structure grammar

$\mathrm{S} \rightarrow \mathrm{NP}$ VP
$\mathrm{VP} \rightarrow \mathrm{VNP}$
$\mathrm{VP} \rightarrow \mathrm{V}$ NP PP
$N P \rightarrow N P N$
$N P \rightarrow N P$ PP
$\mathrm{NP} \rightarrow \mathrm{N}$
$\mathrm{NP} \rightarrow e$
$P P \rightarrow P N P$
$\mathrm{N} \rightarrow$ people
$\mathrm{N} \rightarrow$ fish
$\mathrm{N} \rightarrow$ tanks
$\mathrm{N} \rightarrow$ rods
$\vee \rightarrow$ people
$\vee \rightarrow$ fish
$\mathrm{V} \rightarrow$ tanks
$\mathrm{P} \rightarrow$ with

## Chomsky Normal Form steps

$$

## Chomsky Normal Form

- You should think of this as a transformation for efficient parsing
- With some extra book-keeping in symbol names, you can even reconstruct the same trees with a detransform
- In practice full Chomsky Normal Form is a pain
- Reconstructing n-aries is easy
- Reconstructing unaries/empties is trickier
- Binarization is crucial for cubic time CFG parsing
- The rest isn't necessary; it just makes the algorithms cleaner and a bit quicker

## An example: before binarization...

## After binarization...

## Parsing

## Constituency Parsing

## PCFG

| Rule Prob $\boldsymbol{\theta}_{\boldsymbol{i}}$ |  |
| :--- | :--- |
| $\mathrm{S} \rightarrow$ NP VP | $\theta_{0}$ |
| $\mathrm{NP} \rightarrow$ NP NP | $\theta_{1}$ |
| $\ldots$ |  |
| $\mathrm{~N} \rightarrow$ fish | $\theta_{42}$ |
| $\mathrm{~N} \rightarrow$ people | $\theta_{43}$ |
| $\mathrm{~V} \rightarrow$ fish | $\theta_{44}$ |
| $\ldots$ |  |

## Cocke-Kasami-Younger (CKY) <br> Constituency Parsing

fish people fish tanks

## Viterbi (Max) Scores

## Extended CKY parsing

- Unaries can be incorporated into the algorithm
- Messy, but doesn't increase algorithmic complexity
- Empties can be incorporated
- Use fenceposts
- Doesn't increase complexity; essentially like unaries

## Extended CKY parsing

- Unaries can be incorporated into the algorithm
- Messy, but doesn't increase algorithmic complexity
- Empties can be incorporated
- Use fenceposts
- Doesn't increase complexity; essentially like unaries
- Binarization is vital
- Without binarization, you don't get parsing cubic in the length of the sentence and in the number of nonterminals in the grammar
- Binarization may be an explicit transformation or implicit in how the parser works (Early-style dotted rules), but it's always there.

## A Recursive Parser

```
bestScore(X,i,j,s)
    if (j == i)
    return q(X->s[i])
    else
    return max k,x->yZ
        bestScore(Y,i,k,s) *
        bestScore(Z,k+1,j,s)
```

## The CKY algorithm (1960/1965) ... extended to unaries

```
function CKY(words, grammar) returns [most_probable_parse,prob]
    score = new double[#(words)+1][#(words)+1][#(nonterms)]
    back = new Pair[#(words)+1][#(words)+1][#nonterms]]
    for i=0; i<#(words); i++
        for A in nonterms
        if A -> words[i] in grammar
        score[i][i+1][A] = P(A -> words[i])
        //handle unaries
        boolean added = true
        while added
            added = false
        for A, B in nonterms
            if score[i][i+1][B] > 0 && A->B in grammar
            prob = P(A->B)*score[i][i+1][B]
            if prob > score[i][i+1][A]
            score[i][i+1][A] = prob
            back[i][i+1][A] = B
            added = true
```

## The CKY algorithm (1960/1965) ... extended to unaries

```
for span = 2 to #(words)
    for begin = 0 to #(words)- span
    end = begin + span
    for split = begin+1 to end-1
        for A,B,C in nonterms
        prob=score[begin][split][B]*score[sp1it][end][C]*P(A->BC)
        if prob > score[begin][end][A]
            score[begin]end][A] = prob
        back[begin][end][A] = new Triple(split,B,C)
    //handle unaries
    boolean added = true
    while added
        added = false
        for A, B in nonterms
        prob = P(A->B)*score[begin][end][B];
        if prob > score[begin][end][A]
        score[begin][end][A] = prob
        back[begin][end][A] = B
        added = true
return buildTree(score, back)
```

## Evaluating constituency parsing

Gold standard brackets: S-(0:11), NP-(0:2), VP-(2:9), VP-(3:9), NP-(4:6), PP-(6-9), NP-(7,9), NP-(9:10)

Candidate brackets: S-(0:11), NP-(0:2), VP-(2:10), VP-(3:10), NP-(4:6), PP-(6-10), NP-(7,10)

## Evaluating constituency parsing

Gold standard brackets:
S-(0:11), NP-(0:2), VP-(2:9), VP-(3:9), NP-(4:6), PP-(6-9), NP-(7,9), NP-(9:10)
Candidate brackets:
S-(0:11), NP-(0:2), VP-(2:10), VP-(3:10), NP-(4:6), PP-(6-10), NP-(7,10)

Labeled Precision
$3 / 7=42.9 \%$
Labeled Recall
$3 / 8=37.5 \%$
LP/LR F1
40.0\%

Tagging Accuracy
$11 / 11=100.0 \%$

## How good are PCFGs?

- Penn WSJ parsing accuracy: about 73.7\% LP/LR F1
- Robust
- Usually admit everything, but with low probability
- Partial solution for grammar ambiguity
- A PCFG gives some idea of the plausibility of a parse
- But not so good because the independence assumptions are too strong
- Give a probabilistic language model
- But in the simple case it performs worse than a trigram model
- The problem seems to be that PCFGs lack the lexicalization of a trigram model

## Weaknesses of PCFGs

## Weaknesses

- Lack of sensitivity to structural frequencies
- Lack of sensitivity to lexical information
- (A word is independent of the rest of the tree given its POS!)

## A Case of PP Attachment Ambiguity

(a)

(b)

| Rules |
| :--- |
| $\mathrm{S} \rightarrow$ NP VP |
| NP $\rightarrow$ NNS |
| NP $\rightarrow$ NP PP |
| VP $\rightarrow$ VBD NP |
| NP $\rightarrow$ NNS |
| PP $\rightarrow$ IN NP |
| NP $\rightarrow$ DT NN |
| NNS $\rightarrow$ workers |
| VBD $\rightarrow$ dumped |
| NNS $\rightarrow$ sacks |
| IN $\rightarrow$ into |
| DT $\rightarrow$ a |
| NN $\rightarrow$ bin |

If $q(\mathrm{NP} \rightarrow \mathrm{NP} \mathrm{PP})>q(\mathrm{VP} \rightarrow \mathrm{VP} \operatorname{PP})$ then $(\mathrm{b})$ is more probable, else (a) is more probable.
Attachment decision is completely independent of the words

## A Case of Coordination Ambiguity

(a)

(b)

| Rules |
| :--- | :--- |
| NP $\rightarrow$ NP CC NP |
| (a) $\rightarrow$ NP PP |
| NP $\rightarrow$ NNS |
| NP $\rightarrow$ IN NP |
| NP $\rightarrow$ NNS |
| NP $\rightarrow$ NNS |
| NNS $\rightarrow$ dogs |
| IN $\rightarrow$ in |
| NNS $\rightarrow$ houses |
| CC $\rightarrow$ and |
| NNS $\rightarrow$ cats |

| Rules |
| :--- | :--- |
| (b) $\rightarrow$ NP CC NP |
| NP $\rightarrow$ NP PP |
| NP $\rightarrow$ NNS |
| $\mathrm{PP} \rightarrow$ IN NP |
| NP $\rightarrow$ NNS |
| NP $\rightarrow$ NNS |
| NNS $\rightarrow$ dogs |
| IN $\rightarrow$ in |
| NNS $\rightarrow$ houses |
| CC $\rightarrow$ and |
| NNS $\rightarrow$ cats |

Here the two parses have identical rules, and therefore have identical probability under any assignment of PCFG rule probabilities

## Structural Preferences: Close Attachment

(a)

(b)

- Example: president of a company in Africa
- Both parses have the same rules, therefore receive same probability under a PCFG
- "Close attachment" (structure (a)) is twice as likely in Wall Street Journal text.

## Structural Preferences: Close Attachment

- Example: John was believed to have been shot by Bill
- Low attachment analysis (Bill does the shooting) contains same rules as high attachment analysis (Bill does the believing)
- Two analyses receive the same probability

## PCFGs and Independence

- The symbols in a PCFG define independence assumptions:

$$
\begin{aligned}
& S \rightarrow N P V P \\
& N P \rightarrow D T N N
\end{aligned}
$$

- At any node, the material inside that node is independent of the material outside that node, given the label of that node
- Any information that statistically connects behavior inside and outside a node must flow through that node's label

## Non-Independence I

- The independence assumptions of a PCFG are often too strong

All NPs

NPs under S

NP PP DT NN PRP

NPs under VP

NP PP DT NN PRP

- Example: the expansion of an NP is highly dependent on the parent of the NP (i.e., subjects vs. objects)

## Non-Independence II

- Symptoms of overly strong assumptions:
- Rewrites get used where they don't belong

In the PTB, this
construction is for possessives

## Refining the Grammar Symbols

- We can relax independence assumptions by encoding dependencies into the PCFG symbols, by state splitting:

## Parent annotation <br> [Johnson 98]

Marking possessive NPs

- Too much state-splitting $\rightarrow$ sparseness (no smoothing used!)
- What are the most useful features to encode?

## Linguistics in Unlexicalized Parsing

## Horizontal Markovization

- Horizontal Markovization: Merges States

## Vertical Markovization

- Vertical Markov order: rewrites depend on past $k$ ancestor nodes.
(i.e., parent annotation)

Order 1

Order 2

## Unary Splits

- Problem: unary rewrites are used to transmute categories so a highprobability rule can be used.
- Solution: Mark unary rewrite sites with -U

| Annotation | F1 | Size |
| :--- | :--- | :--- |
| Base | 77.8 | 7.5 K |
| UNARY | 78.3 | 8.0 K |

## Tag Splits

- Problem: Treebank tags are too coarse.
- Example: SBAR sentential complementizers (that, whether, if), subordinating conjunctions (while, after), and true prepositions (in, of, to) are all tagged IN.

- Partial Solution:
- Subdivide the IN tag.

| Annotation | F1 | Size |
| :--- | :--- | :--- |
| Previous | 78.3 | 8.0 K |
| SPLIT-IN | 80.3 | 8.1 K |

## Other Tag Splits

- UNARY-DT: mark demonstratives as DT^U ("the X" vs. "those")
- UNARY-RB: mark phrasal adverbs as RB^U ("quickly" vs. "very")
- TAG-PA: mark tags with non-canonical parents ("not" is an RB^VP)
- SPLIT-AUX: mark auxiliary verbs with -AUX [cf. Charniak 97]
- SPLIT-CC: separate "but" and "\&" from other conjunctions
- SPLIT-\%: "\%" gets its own tag.

| F1 | Size |
| :--- | :--- |
| 80.4 | 8.1 K |
| 80.5 | 8.1 K |
| 81.2 | 8.5 K |
| 81.6 | 9.0 K |
| 81.7 | 9.1 K |
| 81.8 | 9.3 K |

## Yield Splits

- Problem: sometimes the behavior of a category depends on something inside its future yield.
- Examples:
- Possessive NPs
- Finite vs. infinite VPs
- Lexical heads!

- Solution: annotate future elements into nodes.

| Annotation | F1 | Size |
| :--- | :--- | :--- |
| tag splits | 82.3 | 9.7 K |
| POSS-NP | 83.1 | 9.8 K |
| SPLIT-VP | 85.7 | 10.5 K |

## Distance / Recursion Splits

- Problem: vanilla PCFGs cannot distinguish attachment heights.
- Solution: mark a property of higher or lower sites:
- Contains a verb.
- Is (non)-recursive.
- Base NPs [cf. Collins 99]
- Right-recursive NPs

| Annotation | F1 | Size |
| :--- | :--- | :--- |
| Previous | 85.7 | 10.5 K |
| BASE-NP | 86.0 | 11.7 K |
| DOMINATES-V | 86.9 | 14.1 K |
| RIGHT-REC-NP | 87.0 | 15.2 K |

## A Fully Annotated Tree

## Final Test Set Results

| Parser | LP | LR | F1 |
| :--- | :--- | :--- | :--- |
| Magerman 95 | 84.9 | 84.6 | $\mathbf{8 4 . 7}$ |
| Collins 96 | 86.3 | 85.8 | $\mathbf{8 6 . 0}$ |
| Klein \& Manning 03 | 86.9 | 85.7 | $\mathbf{8 6 . 3}$ |
| Charniak 97 | 87.4 | 87.5 | $\mathbf{8 7 . 4}$ |
| Collins 99 | 88.7 | 88.6 | $\mathbf{8 8 . 6}$ |

- Beats "first generation" lexicalized parsers

## Lexicalised PCFGs

## Heads in Context Free Rules

Add annotations specifying the "head" of each rule:

| $S$ | $\Rightarrow$ | $N P$ | $V P$ |
| :--- | :--- | :--- | :--- |
| $V P$ | $\Rightarrow$ | $V i$ |  |
| $V P$ | $\Rightarrow$ | $V t$ | $N P$ |
| $V P$ | $\Rightarrow$ | $V P$ | $P P$ |
| $N P$ | $\Rightarrow$ | $D T$ | $N N$ |
| $N P$ | $\Rightarrow$ | $N P$ | $P P$ |
| $P P$ | $\Rightarrow$ | $I N$ | $N P$ |

| Vi | $\Rightarrow$ | sleeps |
| :--- | :--- | :--- |
| Vt | $\Rightarrow$ | saw |
| NN | $\Rightarrow$ man |  |
| NN | $\Rightarrow$ | woman |
| NN | $\Rightarrow$ | telescope |
| DT | $\Rightarrow$ the |  |
| IN | $\Rightarrow$ with |  |
| IN | $\Rightarrow$ in |  |

## Heads

- Each context-free rule has one "special" child that is the head of the rule. e.g.,

$$
\begin{array}{llll}
S & \Rightarrow & N P & V P \\
V P & \Rightarrow V t & N P & (V P \text { is the head }) \\
N P & \Rightarrow & D T & N N
\end{array} \quad N N \quad(V t \text { is the head) }
$$

- A core idea in syntax
(e.g., see X-bar Theory, Head-Driven Phrase Structure Grammar)
- Some intuitions:
- The central sub-constituent of each rule.
- The semantic predicate in each rule.

## Rules to Recover Heads: An Example for NPs

If the rule contains NN, NNS, or NNP:
Choose the rightmost NN, NNS, or NNP
Else If the rule contains an NP: Choose the leftmost NP
Else If the rule contains a JJ : Choose the rightmost JJ
Else If the rule contains a CD: Choose the rightmost $C D$
Else Choose the rightmost child

> e.g.,

| NP | $\Rightarrow$ | DT | NNP | NN |
| :--- | :--- | :--- | :--- | :--- |
| NP | $\Rightarrow$ | DT | NN | NNP |
| NP | $\Rightarrow$ | NP | PP |  |
| NP | $\Rightarrow$ | DT | JJ |  |
| NP | $\Rightarrow$ | DT |  |  |

## Rules to Recover Heads: An Example for VPs

If the rule contains Vi or Vt : Choose the leftmost Vi or Vt

Else If the rule contains an VP: Choose the leftmost VP
Else Choose the leftmost child
e.g.,

$$
\begin{array}{llll}
\mathrm{VP} & \Rightarrow \mathrm{Vt} & \mathrm{NP} \\
\mathrm{VP} & \Rightarrow \mathrm{VP} & \mathrm{PP}
\end{array}
$$

## Adding Headwords to Trees

$\Downarrow$

## Adding Headwords to Trees

$\Downarrow$

## Adding Headwords to Trees

- A constituent receives its headword from its head child.

| S | $\Rightarrow$ | NP | VP |  |
| :--- | :--- | :--- | :--- | :--- |
| VP | $\Rightarrow$ | Vt | NP |  |
| NP | $\Rightarrow$ | DT |  | NN |

(S receives headword from VP)
(VP receives headword from Vt )
(NP receives headword from NN)

## Lexicalized CFGs in Chomsky Normal Form

- $N$ is a set of non-terminal symbols
- $\Sigma$ is a set of terminal symbols
- $R$ is a set of rules which take one of three forms:
- $X(h) \rightarrow_{1} Y_{1}(h) Y_{2}(w)$ for $X \in N$, and $Y_{1}, Y_{2} \in N$, and $h, w \in \Sigma$
- $X(h) \rightarrow_{2} Y_{1}(w) Y_{2}(h)$ for $X \in N$, and $Y_{1}, Y_{2} \in N$, and $h, w \in \Sigma$
- $X(h) \rightarrow h$ for $X \in N$, and $h \in \Sigma$
- $S \in N$ is a distinguished start symbol

## Example

| $\mathrm{S}($ saw $)$ | $\rightarrow_{2}$ | $\mathrm{NP}($ man $)$ | $\mathrm{VP}($ saw $)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{VP}($ saw $)$ | $\rightarrow_{1}$ | $\mathrm{Vt}($ saw $)$ | $\mathrm{NP}($ dog $)$ |
| $\mathrm{NP}($ man $)$ | $\rightarrow_{2}$ | $\mathrm{DT}($ the $)$ | $\mathrm{NN}($ man $)$ |
| $\mathrm{NP}($ dog $)$ | $\rightarrow_{2}$ | $\mathrm{DT}($ the $)$ | $\mathrm{NN}($ dog $)$ |
| Vt (saw) | $\rightarrow$ | saw |  |
| $\mathrm{DT}($ the $)$ | $\rightarrow$ | the |  |
| $\mathrm{NN}($ man $)$ | $\rightarrow$ | man |  |
| $\mathrm{NN}($ dog $)$ | $\rightarrow$ | dog |  |

## Lexicalized CKY

(VP->VBD . . .NP) [saw]

```
(VP-> VBD[saw] NP[her])
```

bestScore (X,i,j,h)
if (j = i)
return score(X,s[i])

else
return

$$
\begin{aligned}
& \underset{k, h, w}{\max } \operatorname{score}(X[h]->Y[h] Z[w]) * \\
& \text { k,h,w } \\
& \text { X->YZ } \\
& \text { bestScore (Y,i,k,h) * } \\
& \text { bestScore(Z,k+1,j,w) } \\
& \max _{\mathrm{k}, \mathrm{w}} \operatorname{score}(\mathrm{X}[\mathrm{~h}]->\mathrm{Y}[\mathrm{w}] \mathrm{Z}[\mathrm{~h}]) \text { * } \\
& \text { X->YZ } \\
& \text { bestScore (Y,i,k,w) * } \\
& \text { bestScore(Z,k+1,j,h) }
\end{aligned}
$$

## Parsing with Lexicalized CFGs

- The new form of grammar looks just like a Chomsky normal form CFG, but with potentially $O\left(|\Sigma|^{2} \times|N|^{3}\right)$ possible rules.
- Naively, parsing an $n$ word sentence using the dynamic programming algorithm will take $O\left(n^{3}|\Sigma|^{2}|N|^{3}\right)$ time. But $|\Sigma|$ can be huge!!
- Crucial observation: at most $O\left(n^{2} \times|N|^{3}\right)$ rules can be applicable to a given sentence $w_{1}, w_{2}, \ldots w_{n}$ of length $n$. This is because any rules which contain a lexical item that is not one of $w_{1} \ldots w_{n}$, can be safely discarded.
- The result: we can parse in $O\left(n^{5}|N|^{3}\right)$ time.

## Pruning with Beams

- The Collins parser prunes with per-cell beams [Collins 99]
- Essentially, run the O(n ${ }^{5}$ ) CKY
- Remember only a few hypotheses for each span <i,j>.
- If we keep K hypotheses at each
 span, then we do at most $O\left(\mathrm{nK}^{2}\right)$ work per span (why?)
- Keeps things more or less cubic
- Also: certain spans are forbidden entirely on the basis of punctuation (crucial for speed)

## Parameter Estimation

$$
\begin{aligned}
\mathrm{p}(\mathrm{t})= & q\left(\mathrm{~S}(\text { saw }) \rightarrow_{2} \mathrm{NP}(\text { man }) \mathrm{VP}(\text { saw })\right) \\
& \times q\left(\mathrm{NP}(\text { man }) \rightarrow_{2} \mathrm{DT}(\text { the }) \mathrm{NN}(\text { man })\right) \\
& \times q\left(\mathrm{VP}(\text { saw }) \rightarrow_{1} \mathrm{VP}(\text { saw }) \mathrm{PP}(\text { with })\right) \\
& \times q\left(\mathrm{VP}(\text { saw }) \rightarrow_{1} \mathrm{Vt}(\text { saw }) \mathrm{NP}(\text { dog })\right) \\
& \times q\left(\mathrm{PP}(\text { with }) \rightarrow_{1} \mathrm{IN}(\text { with }) \mathrm{NP}(\text { telescope })\right) \\
& \times \ldots
\end{aligned}
$$

## A Model from Charniak (1997)

- An example parameter in a Lexicalized PCFG:

$$
q\left(\mathrm{~S}(\text { saw }) \rightarrow_{2} \mathrm{NP}(\text { man }) \mathrm{VP}(\text { saw })\right)
$$

- First step: decompose this parameter into a product of two parameters

$$
\begin{aligned}
& q\left(\mathrm{~S}(\text { saw }) \rightarrow_{2} \mathrm{NP}(\text { man }) \vee \mathrm{VP}(\text { saw })\right) \\
= & q\left(\mathrm{~S} \rightarrow_{2} \mathrm{NP} \vee P \mid \mathrm{S}, \text { saw }\right) \times q\left(\text { man } \mid \mathrm{S} \rightarrow_{2} \mathrm{NP} \mathrm{VP}, \text { saw }\right)
\end{aligned}
$$

## A Model from Charniak (1997)

$$
\begin{aligned}
& q\left(\mathrm{~S}(\text { saw }) \rightarrow_{2} \mathrm{NP}(\text { man }) \vee \mathrm{VP}(\text { saw })\right) \\
= & q\left(\mathrm{~S} \rightarrow_{2} \mathrm{NP} \mathrm{VP} \mid \mathrm{S}, \text { saw }\right) \times q\left(\text { man } \mid \mathrm{S} \rightarrow_{2} \mathrm{NP} V P, \text { saw }\right)
\end{aligned}
$$

- Second step: use smoothed estimation for the two parameter estimates

$$
\begin{aligned}
& q\left(\mathrm{~S} \rightarrow_{2} \mathrm{NP} \text { VP } \mid \mathrm{S}, \text { saw }\right) \\
= & \lambda_{1} \times q_{M L}\left(\mathrm{~S} \rightarrow_{2} \mathrm{NP} \text { VP } \mid \mathrm{S}, \text { saw }\right)+\lambda_{2} \times q_{M L}\left(\mathrm{~S} \rightarrow_{2} \mathrm{NP} \mathrm{VP} \mid \mathrm{S}\right) \\
& q\left(\operatorname{man} \mid \mathrm{S} \rightarrow_{2} \mathrm{NP} \text { VP, saw }\right) \\
= & \lambda_{3} \times q_{M L}\left(\operatorname{man} \mid \mathrm{S} \rightarrow_{2} \mathrm{NP} \text { VP, saw }\right)+\lambda_{4} \times q_{M L}\left(\operatorname{man} \mid \mathrm{S} \rightarrow_{2} \mathrm{NP} \text { VP }\right) \\
& +\lambda_{5} \times q_{M L}(\text { man } \mid \mathrm{NP})
\end{aligned}
$$

## Final Test Set Results

| Parser | LP | LR | F1 |
| :--- | :--- | :--- | :--- |
| Magerman 95 | 84.9 | 84.6 | $\mathbf{8 4 . 7}$ |
| Collins 96 | 86.3 | 85.8 | $\mathbf{8 6 . 0}$ |
| Klein \& Manning 03 | 86.9 | 85.7 | $\mathbf{8 6 . 3}$ |
| Charniak 97 | 87.4 | 87.5 | $\mathbf{8 7 . 4}$ |
| Collins 99 | 88.7 | 88.6 | $\mathbf{8 8 . 6}$ |

## Analysis/Evaluation (Method 2)

| $\left\langle\mathrm{ROOT}_{0}\right.$, | $\mathrm{saw}_{3}$, | $\mathrm{ROOT}\rangle$ |
| :--- | :--- | :--- |
| $\left\langle\operatorname{saw}_{3}\right.$, | $\mathrm{man}_{2}$, | $\mathrm{S} \rightarrow_{2}$ NP VP $\rangle$ |
| $\left\langle\operatorname{man}_{2}\right.$, | the $_{1}$, | $\left.\mathrm{NP} \rightarrow_{2} \mathrm{DT} \mathrm{NN}\right\rangle$ |

| $\left\langle\operatorname{dog}_{5}\right.$, | the $_{4}$, | $\left.\mathrm{NP} \rightarrow_{2} \mathrm{DT} \mathrm{NN}\right\rangle$ |
| $\left\langle\right.$ with $_{6}$, | telescope $_{8}$, | $\mathrm{PP} \rightarrow_{1}$ IN NP $\rangle$ |
| $\left\langle\right.$ telescope $_{8}$, | the $_{7}$, | $\left.\mathrm{NP} \rightarrow_{2} \mathrm{DT} \mathrm{NN}\right\rangle$ |

## Dependency Accuracies

- All parses for a sentence with $n$ words have $n$ dependencies Report a single figure, dependency accuracy
- Results from Collins, 2003: 88.3\% dependency accuracy
- Can calculate precision/recall on particular dependency types e.g., look at all subject/verb dependencies $\Rightarrow$ all dependencies with label $\mathrm{S} \rightarrow_{2}$ NP VP

Recall $=$
number of subject/verb dependencies correct number of subject/verb dependencies in gold standard

Precision $=$
number of subject/verb dependencies correct number of subject/verb dependencies in parser's output

## Strengths and Weaknesses of Modern Parsers

(Numbers taken from Collins (2003))

- Subject-verb pairs: over $95 \%$ recall and precision
- Object-verb pairs: over $92 \%$ recall and precision
- Other arguments to verbs: $\approx 93 \%$ recall and precision
- Non-recursive NP boundaries: $\approx 93 \%$ recall and precision
- PP attachments: $\approx 82 \%$ recall and precision
- Coordination ambiguities: $\approx 61 \%$ recall and precision
