

# Image warping

# Image warping

image filtering: change *range* of image

$$g(x) = h(f(x))$$

$$h(y) = 0.5y + 0.5$$

image warping: change *domain* of image

$$g(x) = f(h(x))$$

$$h([x,y]) = [x, y/2]$$

# Parametric (global) warping

---

Examples of parametric warps:

translation

rotation

aspect

affine

perspective

cylindrical

# Parametric (global) warping

$$\mathbf{p} = (x, y)$$

$$\mathbf{p}' = (x', y')$$

- Transformation  $T$  is a coordinate-changing machine:  $\mathbf{p}' = T(\mathbf{p})$
- What does it mean that  $T$  is global?
  - Is the same for any point  $\mathbf{p}$
  - can be described by just a few numbers (parameters)
- Represent  $T$  as a matrix:  $\mathbf{p}' = \mathbf{M} * \mathbf{p}$ 
$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \mathbf{M} \begin{bmatrix} x \\ y \end{bmatrix}$$

# Scaling

- *Scaling* a coordinate means multiplying each of its components by a scalar
- *Uniform scaling* means this scalar is the same for all components:

# Scaling

- *Non-uniform scaling*: different scalars per component:

$$f\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = g\left(\begin{bmatrix} x' \\ y' \end{bmatrix}\right)$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 2x \\ 0.5y \end{bmatrix}$$

# Scaling

---

- Scaling operation:  $x' = ax$   
 $y' = by$

- Or, in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \underbrace{\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}}_{\text{scaling matrix } S} \begin{bmatrix} x \\ y \end{bmatrix}$$

What's inverse of S?

## 2-D Rotation

---

- This is easy to capture in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \underbrace{\begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix}}_{\mathbf{R}} \begin{bmatrix} x \\ y \end{bmatrix}$$

- Even though  $\sin(\theta)$  and  $\cos(\theta)$  are nonlinear to  $\theta$ ,
  - $x'$  is a linear combination of  $x$  and  $y$
  - $y'$  is a linear combination of  $x$  and  $y$
- What is the inverse transformation?
  - Rotation by  $-\theta$
  - For rotation matrices,  $\det(\mathbf{R}) = 1$  so  $\mathbf{R}^{-1} = \mathbf{R}^T$

# 2x2 Matrices

---

- What types of transformations can be represented with a 2x2 matrix?

2D Identity?

$$\begin{aligned} x' &= x \\ y' &= y \end{aligned} \quad \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

2D Scale around (0,0)?

$$\begin{aligned} x' &= s_x * x \\ y' &= s_y * y \end{aligned} \quad \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

# 2x2 Matrices

---

- What types of transformations can be represented with a 2x2 matrix?

2D Rotate around (0,0)?

$$x' = \cos \theta * x - \sin \theta * y$$

$$y' = \sin \theta * x + \cos \theta * y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

2D Shear?

$$x' = x + sh_x * y$$

$$y' = sh_y * x + y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & sh_x \\ sh_y & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

# 2x2 Matrices

---

- What types of transformations can be represented with a 2x2 matrix?

2D Mirror about Y axis?

$$\begin{aligned}x' &= -x \\ y' &= y\end{aligned}\quad \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

2D Mirror over (0,0)?

$$\begin{aligned}x' &= -x \\ y' &= -y\end{aligned}\quad \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

# All 2D Linear Transformations

---

- Linear transformations are combinations of
  - Scale,
  - Rotation,
  - Shear, and
  - Mirror
- Properties of linear transformations:
  - Origin maps to origin
  - Lines map to lines
  - Parallel lines remain parallel
  - Ratios are preserved
  - Closed under composition

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

# 2x2 Matrices

---

- What types of transformations can **not** be represented with a 2x2 matrix?

2D Translation?

$$x' = x + t_x$$

**NO!**

$$y' = y + t_y$$

Only linear 2D transformations  
can be represented with a 2x2 matrix

# Translation

- Example of translation

Homogeneous Coordinates

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

$$\begin{aligned} t_x &= 2 \\ t_y &= 1 \end{aligned}$$

# Affine Transformations

---

- Affine transformations are combinations of
  - Linear transformations, and
  - Translations
- Properties of affine transformations:
  - Origin does not necessarily map to origin
  - Lines map to lines
  - Parallel lines remain parallel
  - Ratios are preserved
  - Closed under composition
  - Models change of basis

$$\begin{bmatrix} x' \\ y' \\ w \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

# Projective Transformations

---

- Projective transformations
  - Affine transformations, and
  - Projective warps
- Properties of projective transformations:
  - Origin does not necessarily map to origin
  - Lines map to lines
  - Parallel lines do not necessarily remain parallel
  - Ratios are not preserved
  - Closed under composition
  - Models change of basis

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

# Image warping

- Given a coordinate transform  $\mathbf{x}' = T(\mathbf{x})$  and a source image  $I(\mathbf{x})$ , how do we compute a transformed image  $I'(\mathbf{x}') = I(T(\mathbf{x}))$ ?

# Forward warping

- Send each pixel  $I(\mathbf{x})$  to its corresponding location  $\mathbf{x}' = T(\mathbf{x})$  in  $I'(\mathbf{x}')$

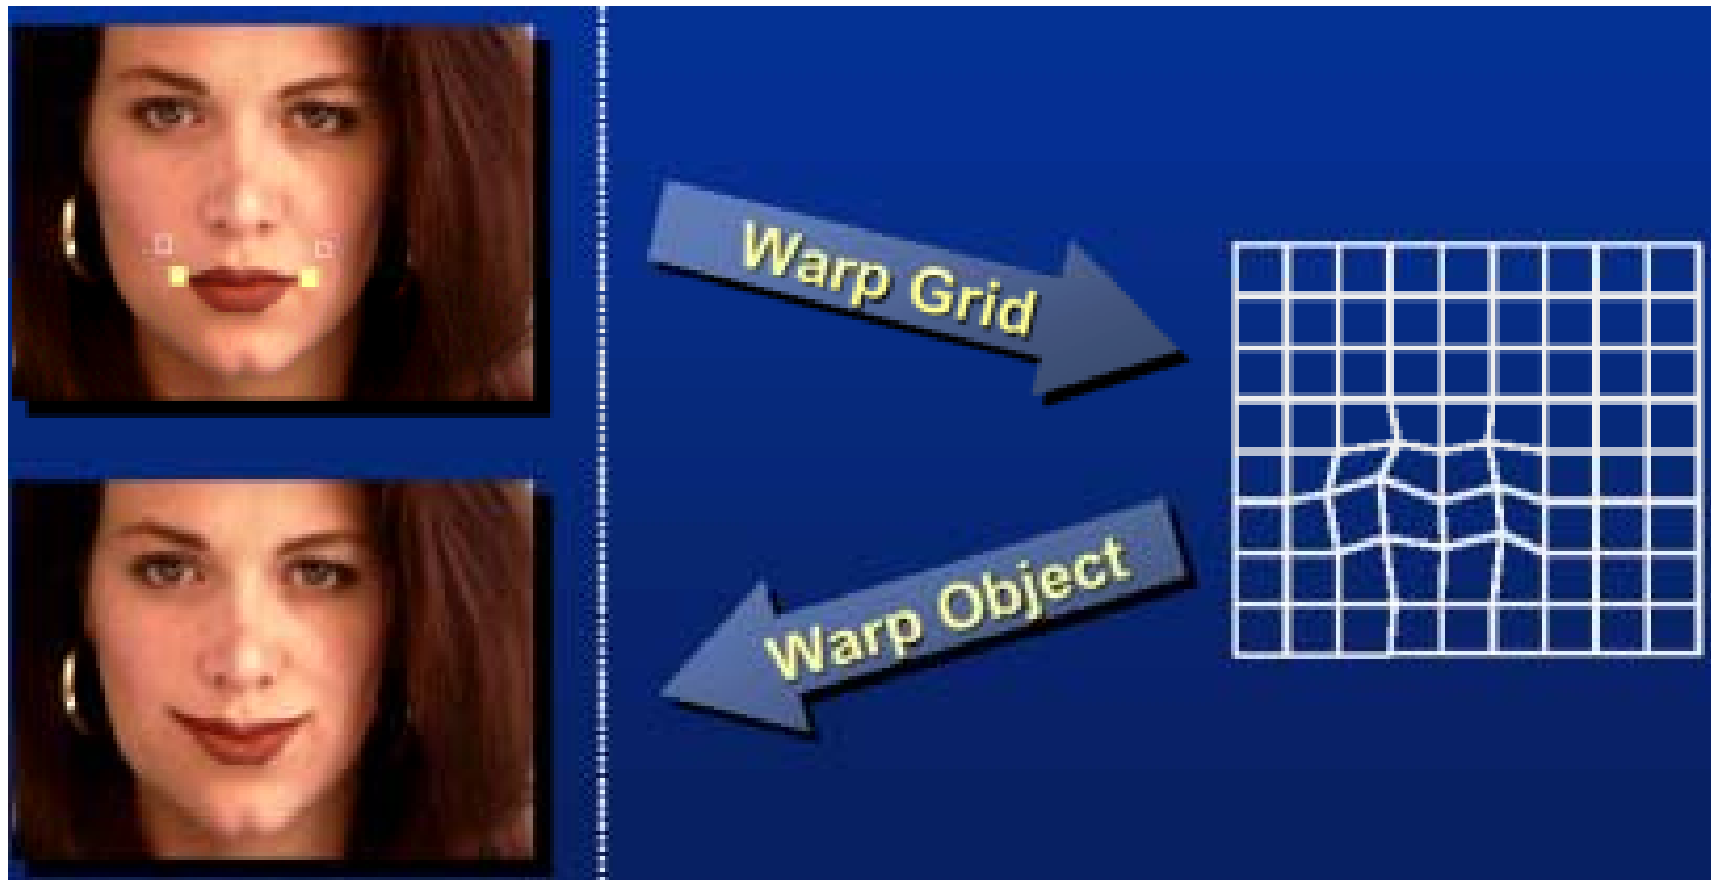

# Inverse warping

- Get each pixel  $I'(x')$  from its corresponding location  $x = T^{-1}(x')$  in  $I(x)$

# Non-parametric image warping

- Specify a more detailed warp function
- Splines, meshes, optical flow (per-pixel motion)

# Non-parametric image warping

- Mappings implied by correspondences
- Inverse warping

# Non-parametric image warping

$$P = w_A A + w_B B + w_C C$$

$$P' = w_A A' + w_B B' + w_C C'$$

*Barycentric coordinate*

# Barycentric coordinates

---

$$P = t_1 A_1 + t_2 A_2 + t_3 A_3$$

$$t_1 + t_2 + t_3 = 1$$

# Non-parametric image warping

$$P = w_A A + w_B B + w_C C$$

$$P' = w_A A' + w_B B' + w_C C'$$

*Barycentric coordinate*

# Image morphing

# Image morphing

---

- The goal is to synthesize a fluid transformation from one image to another.
- Cross dissolving is a common transition between cuts, but it is not good for morphing because of the ghosting effects.

image #1

dissolving

image #2

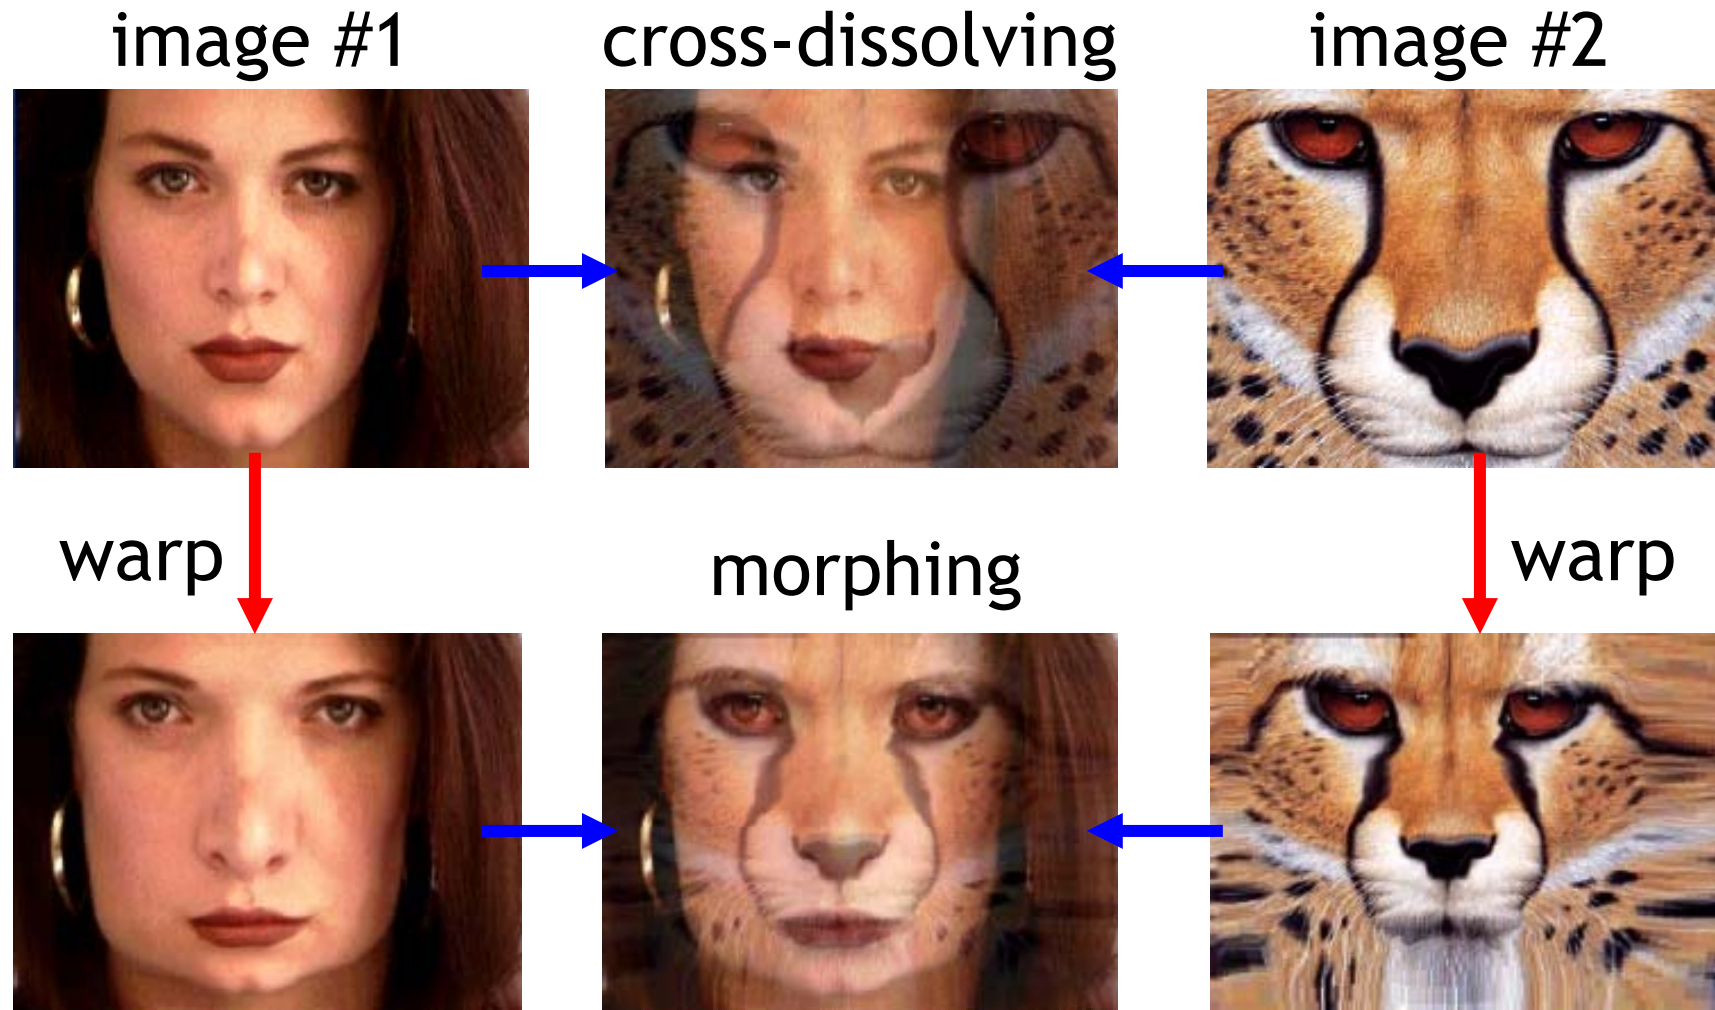

# Image morphing

---

- Why ghosting?
- Morphing = warping + cross-dissolving

# Image morphing

# Warp specification (mesh warping)

---

- How can we specify the warp?
  1. Specify corresponding *spline control points*  
*interpolate* to a complete warping function

easy to implement, but less expressive

# Warp specification

---

- How can we specify the warp
  1. Specify a bounding box
  2. Specify corresponding *points*
    - *interpolate* to a complete warping function

# Solution: convert to mesh warping

---

1. Define a triangular mesh over the points
  - Same mesh in both images!
  - Now we have triangle-to-triangle correspondences
2. Warp each triangle separately from source to destination
  - How do we warp a triangle?
  - 3 points = affine warp!
  - Just like texture mapping

# Warp specification (field warping)

---

- How can we specify the warp?
  3. Specify corresponding *vectors*
    - *interpolate* to a complete warping function
    - The Beier & Neely Algorithm

# Beier&Neely (SIGGRAPH 1992)

- Single line-pair PQ to P'Q':

$$u = \frac{(X - P) \cdot (Q - P)}{\|Q - P\|^2} \quad (1)$$

$$v = \frac{(X - P) \cdot \text{Perpendicular}(Q - P)}{\|Q - P\|} \quad (2)$$

$$X' = P' + u \cdot (Q' - P') + \frac{v \cdot \text{Perpendicular}(Q' - P')}{\|Q' - P'\|} \quad (3)$$

# Algorithm (single line-pair)

- For each  $X$  in the destination image:
  1. Find the corresponding  $u, v$
  2. Find  $X'$  in the source image for that  $u, v$
  3.  $\text{destinationImage}(X) = \text{sourceImage}(X')$
- Examples:

Affine transformation

# Multiple Lines

$$D_i = X_i' - X_i$$

$$weight[i] = \left( \frac{length[i]^p}{a + dist[i]} \right)^b$$

$length$  = length of the line segment,

$dist$  = distance to line segment

The influence of  $a$ ,  $p$ ,  $b$ . The same as the average of  $X_i'$

# Full Algorithm

---

```
WarpImage(SourceImage, L'[...], L[...])
begin
    foreach destination pixel X do
        XSum = (0,0)
        WeightSum = 0
        foreach line L[i] in destination do
            X'[i] = X transformed by (L[i], L'[i])
            weight[i] = weight assigned to X'[i]
            XSum = Xsum + X'[i] * weight[i]
            WeightSum += weight[i]
        end
        X' = XSum/WeightSum
        DestinationImage(X) = SourceImage(X')
    end
    return Destination
end
```

# Resulting warp
