Topic Quickhull

$$T(n) = T(L) + T(R) + O(n)$$

$$L \gg R \Rightarrow T(R) \approx \Theta(n^2)$$

1. Pair up points arbitrary  
( $\frac{n}{2}$  pairs)  $O(n)$

2. Among the  $\frac{n}{2}$  pairs, find the pair, say  $(l^m, r^m)$  that has the "median slope" among all the  $\frac{n}{2}$  pairs.  
 $\downarrow$   
random pair  $O(n)$

3. Find the extreme point orthogonal  $O(n)$  in direction to  $(l^m, r^m)$ , call  $p_m$ .  
Draw a vertical line - thru  $p_m$  and use it to subdivide the problem

Now prune the points on  
-the basis of the following test

$O(n)$  In the left subproblem,  
Consider a pair  $p_1, p_2$  ( $p_2$  is  
closer to the vertical line). If  
 $p_m, p_2, p_1$  is a right turn, then  
we can discard  $p_2$   
(Like wise for the right subprob)

5. Call the algorithm recursively  
on the left and right subset  
of remaining points.

(if there are some output points)

No subproblem has size  $\geq \frac{3}{4}n$

$$T(n, h) \leq T(n_l, h_l) + T(n_r, h-h_l-1) + O(n)$$

# input points

# output points

$$T(n, 1) = c_1 \cdot n$$

$$n_l, n_r \leq \frac{3}{4}n$$

$$T(n, h) \leq T(n_1, h_1) + T(n_2, h_2) + c \cdot n$$

Claim: Soln is of the form  $T(n, h) =$

Proof by induction  $= O(n \log_2 h) = k n \log_2 h$

verify Plug in this soln and

$$T(n_1, h_1) = k n_1 \log_2 h_1$$

$$T(n_2, h_2) = k n_2 \log_2 (h - h_1)$$

R.H.S.  $k (n_1 \log_2 h_1 + n_2 \log_2 (h - h_1)) + c n$

Since  $n_i \leq \frac{3}{4} n$

$$\Rightarrow k n \left( \alpha \log_2 h_1 + (1 - \alpha) \log_2 (h - h_1) \right) + c n$$

$\frac{1}{2} < \alpha < \frac{3}{4}$

To maximize the R.H.S. w.r.t  $h_1$

it is obtained when  $h_1 = \alpha \cdot h$

$$\alpha \log_2(\alpha \cdot h) + (1 - \alpha) \log_2((1 - \alpha) \cdot h)$$

$$\leq \log_2 \alpha h = \log_2 h - \log_2 \frac{4}{3}$$

$$k n (\log_2 h - \log_2 \frac{4}{3}) + c n \leq k n \log_2 h$$

$$\Rightarrow k > \frac{c}{\log_2 \frac{4}{3}}$$

Mod. Quickhull runs in  $O(n \log n)$  steps

If we chose a splitter at random, the running time of quicksort is expected  $O(n \log n)$

Similar result follows for quickhull i.e. expected  $O(n \log n)$ .
